

Returning to a Workout Routine

Kyle Marlia-Conner

Module 5

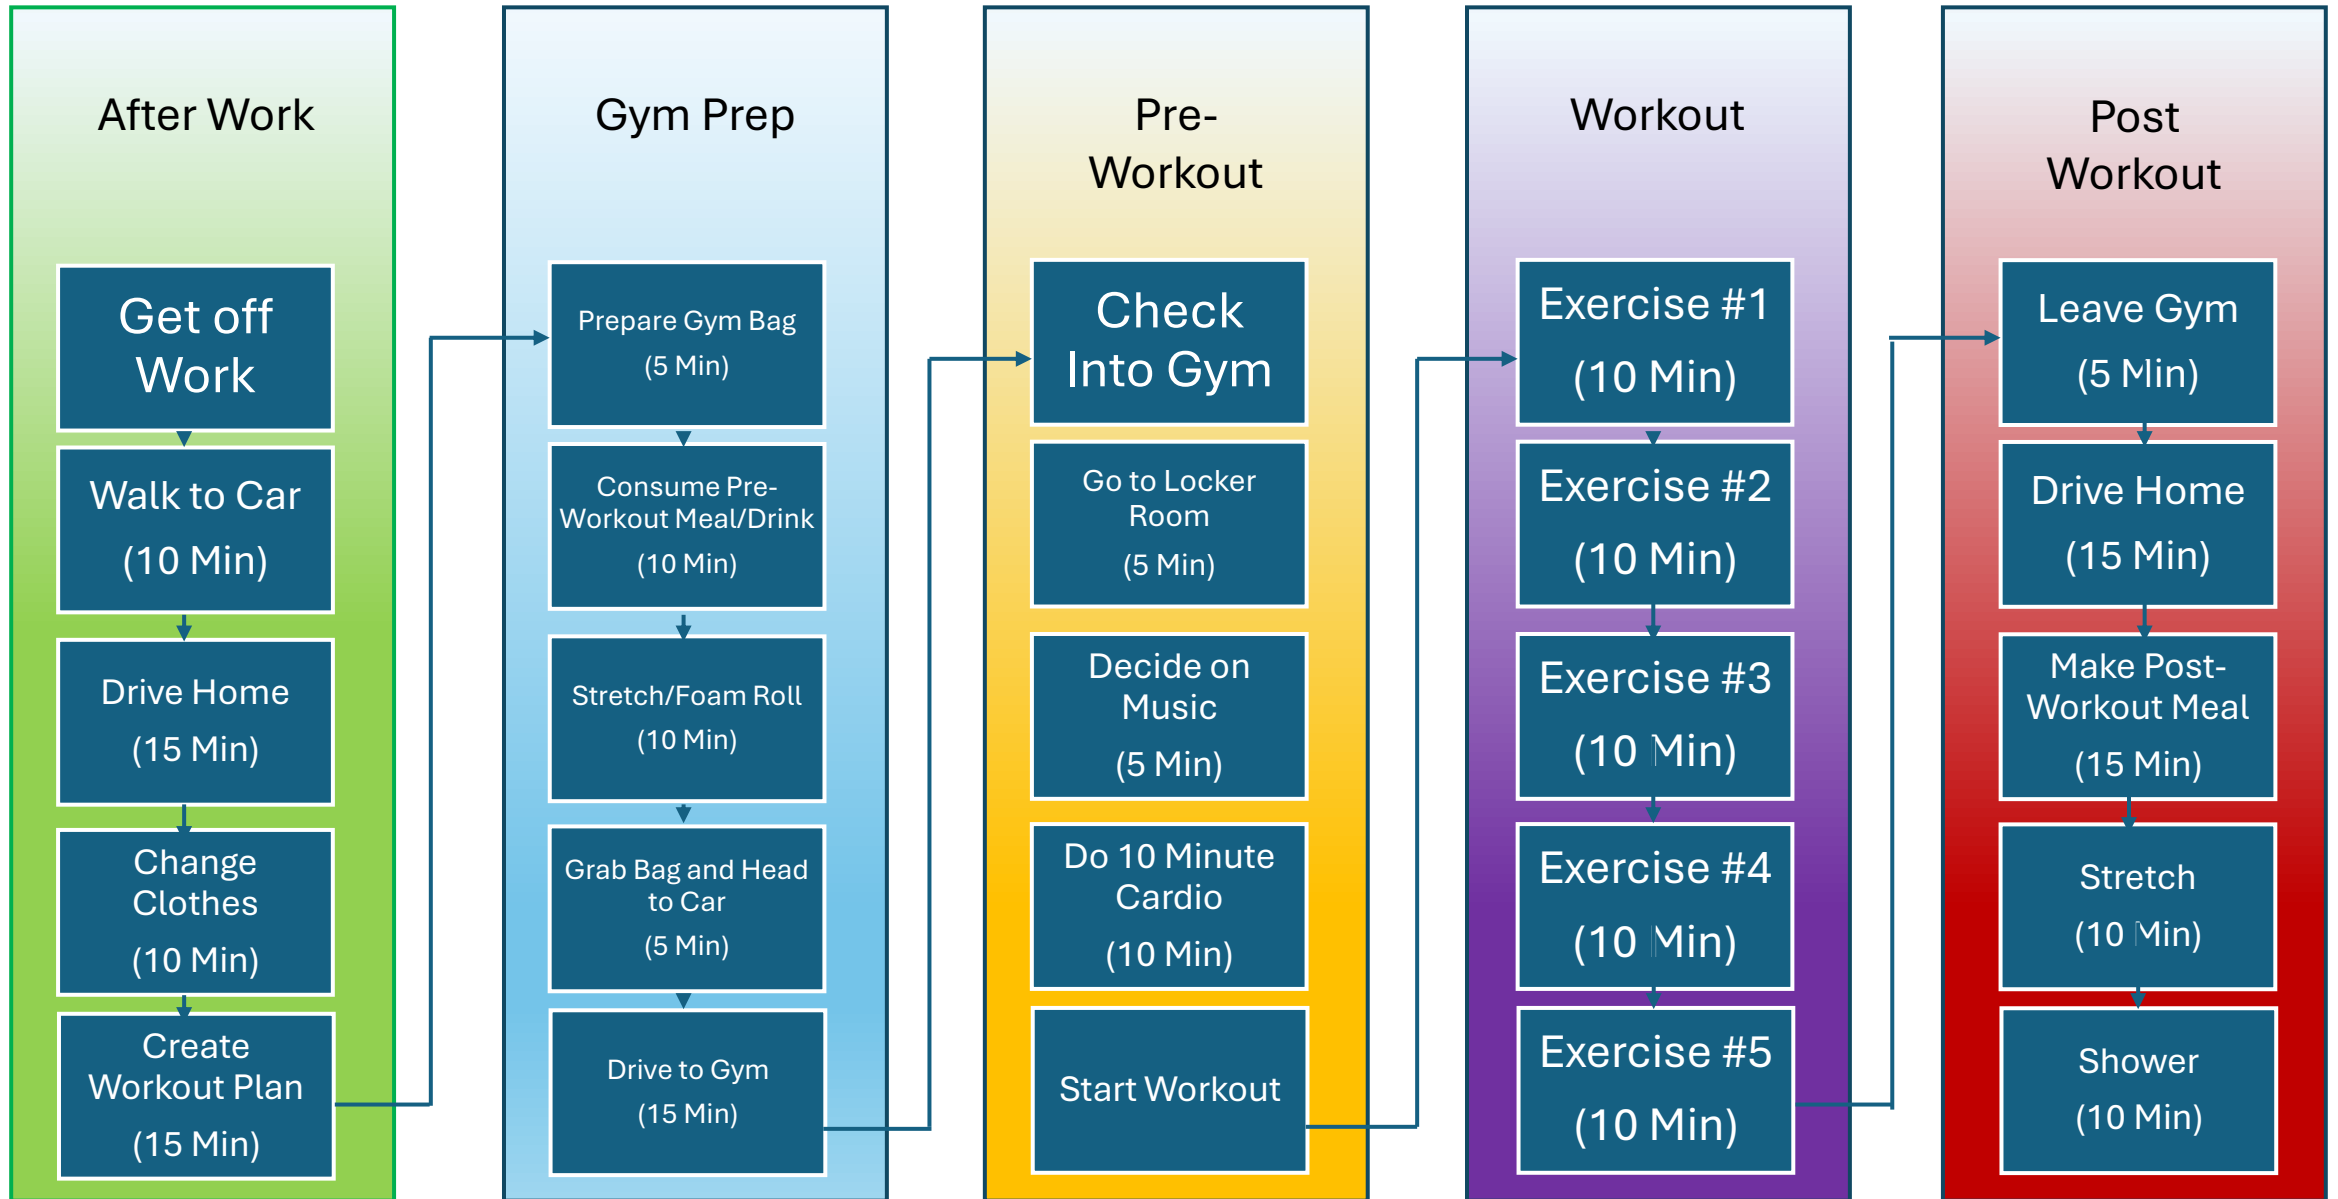

Background and Goals

From 2016 to 2020, I went to the gym 5/6 times a week. It was a home away from home, where I could constantly challenge myself and meet new people. When COVID-19 became a thing, I had to stop. Now, years later, I want to get back into this routine as it benefited a lot of other aspects of my life besides my fitness (Depression and stress mainly, but with stress I don't eat, so we can also throw nutrition). Though I have tried to get back into a routine in the past two years, I haven't been able to stick with it. Working retail full time means my schedule fluctuates week-to-week, and adding school on top of that, I am always thinking about what I NEED to do, and what I WANT to do with my limited time. Taking this as my primary focus for this assignment, I hope to notice what takes the most time, and what "fat" I can trim to better understand the time I could utilize for myself and school. This will be using this past week as my example.

Estimated Average Flow Time

Value Stream Map Stage	Estimated Time
After Work	50 Minutes
Gym Prep	45 Minutes
Pre-Workout	20 Minutes
Workout	50 Minutes
Post Workout	55 Minutes
<u>Total Time:</u>	220 Minutes (3 Hours 40 Minutes)

Analyzing Lean Metrics

Optimizing my routine

Value Stream Map Stage	Optimization
After Work	Right off the bat, it is apparent how much time I would save on any given day if I just went straight from work to the gym. It would only be a five-minute drive compared to the 30 minutes it would take to go home first, then travel back out. Added to this, by spending one day a week preparing a workout plan instead of trying to decide day-to-day would save an extra 15 minutes on the days that I do go to the gym. Just by doing these two things, it would drop my total estimated time from 50 minutes down to 20 minutes and doesn't include the time savings I might get from having my gym bag prepared before I went to work as well. This could effectively make my After Work stage only the five-minute commute to the gym.
Gym Prep	This stage almost becomes obsolete when optimizing the After Work stage. The only things that I would need to do is get comfortable utilizing the foam rollers/stretching equipment my gym offers (or just bring my own foam roller and stuff it into my locker when I'm done) as well as bringing my pre-workout fuel with me to work. This combined with the optimization above, would turn something that usually takes 95 minutes into about 30 minutes, giving me an extra hour of time that I could split amongst other daily activities.
Pre-Workout	There's not much that I could do to alter this step for time savings, but having a playlist/podcast already decided beforehand would help eliminate any distractions I might get when using my phone.
Workout	Being completely focused on time-under-tension, there really is no waste during the actual workout. Each exercise starts with a warm-up set, followed by a minute rest. Then three working sets of ten with the goal of performing each of these sets in a timed minute interval, not just if I can complete it.
Post Workout	The Post-Workout stage is almost like the Pre-Workout stage with not really having the ability to trim any time. Leaving the gym usually includes using the restroom, then the painful jaunt to the front door. I usually chat with whoever is at the desk for a minute to help with social anxiety and also getting to know the people better. Though, if I had my post workout meal already prepped, and cut my shower time down, I could potentially save about 15-20 minutes.
